Phone: 289-834-3676

Mail: ishy.slr@gmail.com

PROFILE:

Supply Chain Analyst at Aramark. Dedicated to asking 'Yes and how'? at every opportunity. Passionate about learning the ins-and-outs of products, building relations with clients and fitting the company culture. Strong problem solving skills and detail-oriented mindset cultured from a background in Engineering.

EDUCATION:

University of Toronto:

September 2019 - April 2025

BASc Mechanical Engineering

- 4th-Year GPA: 3.38 / 4.00
- Professional Experience Year & Minor in Engineering Business

SKILLS:

- **Excel** - PowerQuery, What if analysis, Lookups, Dynamic filtering
- **SQL** - DQL & DML
- **Python** - Pandas & DuckDB
- **Supply Chain Processes**: RFP, RFQ, Contract Changes, COPs

WORK EXPERIENCE:

Aramark Canada - Mississauga, ON

Supply Chain Data Analyst - RFP Analytics Team

September 2025 - Present

- Pulled, cleaned, and analyzed large datasets (400k + rows) daily using a repertoire of **Excel**, **SQL** and **Python**. Managed and updated central databases in **Snowflake** and **UI Bakery**.
- Helped improve average response time from **5 days** → **3 days** with our primary Healthcare partner by researching questions, creating monthly update reports and proactively communicating ad hoc product updates.
- Managed to reduce time to completion of two major yearly projects from **1.5 months** → **3 weeks** by organizing work into sections, clarifying questions with management, and automating with Python + Excel tools.
- Took ownership of the Commitment Tracking initiative, including planning timelines, organizing meetings with relevant stakeholders and conducting all analysis work for phases 1-3. Resulted in over **\$100k** in enrichment for our business.
- Continuously collaborating with procurement, finance, legal and other cross-functional teams to gain feedback and find improvements in data needs.

Toronto Transit Commission (TTC) - Toronto, ON

Procurement & Category Management Co-op - Construction Projects

May 2023 - August 2024

- Managed 10 post-award contracts for planning, design, construction and administration of infrastructure projects totaling over \$10M.
- Created, issued and revised **CCs, CDs, RFQs and COPs** using MicroStrategy reports, SAP/Ariba, and CMS softwares - keeping a **90% compliance rate**.
- Co-ordinated with TTC estimating, scheduling and cost management teams to review and prepare 118 estimates for projects resulting in reduced payments by an **average of 20%**.
- Prepared presentations to management and clients, proactively keeping all stakeholders updated.
- Utilized continuous improvement principles by creating personal task tracker spreadsheets to track discrepancies and incrementally resolve them.

AWARDS & ACHIEVEMENTS:

- Bonuses for completing Commitment Tracking and 2026 RFP Scoring Projects at Aramark ahead of schedule.
- **1 of 20** people selected to be part of Aramark's AI Builders initiative.
- UofT Lassonde Entrance Scholarship.

ACADEMIC PROJECTS:

4th-Year Capstone - Solar PV Panel Sourcing

September 2024 - April 2025

- Developed Bills of Materials (BOMs) and RFIs to support procurement and construction of solar thermal collectors and PV panels in San Vicente, Mexico.
- Implemented QA/QC procedures such as validating supplier certifications through recognized third-parties resulting in product compliance with IEC standards.
- Created functioning prototype and optimized heat transfer through system using ANSYS simulation, resulting in a 20% cost decrease.

Product Design - MIE540 Design Project

January 2025 - April 2025

- Created a comprehensive business case for a sample ping-pong launcher including the creation of a Product Functional Decomposition (PFD) diagram and Failure Mode Effect Analysis (FMEA) table to select relevant control factors and specifications.
- Utilized Taguchi experiments with an L9 matrix to determine product receptivity to noise.
- Developed a supplier scorecard system to evaluate vendor performance based on cost, quality, and delivery metrics.
- Created functioning prototype with 3-D printing; utilizing AutoCAD to model parts.

Life Cycle Assessment - MIE315 Consulting Project

January 2023 - April 2023

- Conducted a comprehensive Life Cycle Assessment (LCA) using standardized frameworks (ISO 14040/44), evaluating environmental impacts of LED vs CFL bulbs across sourcing, production, use, and disposal phases.
- Performed a financial feasibility analysis, including capital and operational cost estimates with payback period, NPV, and sensitivity analysis.
- Compiled and presented findings in a professional technical report, offering actionable design and implementation insights.

PERSONAL PROJECTS:

Automated Prediction-Market Tracking (Gold Settlement based on Polymarket Live Odds)

- **Tools:** Python · REST APIs · Matplotlib · Plotly · SMTP · Cron · Bash
- Built a tool that automatically checks Polymarket's odds on June Gold prices every day, pulls in the full price history, and tracks how the odds shift over time, storing everything without creating duplicates or losing past data.
- Generates both a quick-glance chart and a fully interactive, zoomable chart, then emails a daily summary highlighting the biggest changes since the previous day.
- Found and fixed bugs with the automation silently failing whenever the computer went to sleep by redesigning it to check in more frequently and skip itself once it's already up to date.
- **Thesis:** wanted an easy, free way to get daily updates on how prediction markets react to news, without manually checking the website.
- **Next steps:** Scraping data on this topic from multiple prediction markets to find arbitrage opportunities and patterns.

Automated Technical-Analysis Reporting Tool (For \$MU / Micron based on Nasdaq Data)

- **Tools:** Python · Time-Series Analysis · Matplotlib · Plotly · REST APIs · SMTP · Cron
- Built a tool that pulls a year of stock price history (in this case for Micron) and calculates & plots the 9, 21 and 48 day EMAs.
- Automatically updates the price history, the stock chart and EMAs, and emails it to me after market close every 24 hours.
- Automatically flags when short-term and long-term trends cross over each other and emails a daily chart with summary of differences between today and yesterday's price action.

- **Thesis:** Based on advice I got from a Youtuber I follow who theorized Micron stock is following the 9 and 21 day EMAs to a tee, with strong support at the 48 day EMA. I wanted to plot and test it for myself over 2 weeks and email it to myself so I could get the updates even when I don't have my laptop. Findings were spot on with what the video theorized = since May of 2026, everytime \$MU retraces below the 9 day but above the 21 day EMA it rallies higher, creating a great dip buying opportunity.
- **Next steps:** Repeat this for remaining stocks in my personal investment portfolio to test whether this is an outlier created by a stock that is the beneficiary of being in the hottest sector currently.

Local Google Docs Clone - Real time collaborative document editor built and hosted locally

- **Tools:** Next.js 16, TypeScript, Convex, TipTap/ProseMirror, Tailwind, shadcn/ui
- Prompt engineered a fully working clone of Google Docs. Multiple people can edit the same document at the same time and see each other's changes appear instantly, with live avatars showing who's currently in the document
- Designed two custom formatting features (text size and indentation controls) that didn't exist out of the box in the tools used, and made a deliberate trade-off when a recommended technical setting would have broken the undo button — choosing the version that actually worked for users
- **Thesis:** Wanted to create a real test of how far AI-assisted development can go and test what type of prompts are needed to efficiently build, debug, curl and deploy a simple but common application like Google Docs.
- **Next Steps:** Add live cursors, comments, and real user accounts; and test larger more direct prompts so future builds need less back & forth troubleshooting along the way.
